We had a call with them yesterday. They believe they have a "pyrolysis" event, not a fire. They believe if they can vent the heat and pressure, they will start to see better gas values (methane and CO2) and lowering balance gas and CO. They are going to send us summary reports every two weeks on well adjustments and well readings. They are also going to make sure the landfill cover isn't letting any air in. We're going to the MECC conference in Overland park this week and have set up a meeting with Chris Nagel from Missouri to get his input as well.

Thanks again for your help Gary. We'll keep sending you updates as we receive them.

Todd

Todd – Thanks. It's only three months of data, but the high temperature, low oxygen, low methane and elevated CO are definitely a concern.

Take Care,

Gary Bertram

Hi Gary,

Sorry it's been a while since we've given an update. I've attach a more comprehensive data file from them. There has been more testing data submitted but it hasn't always been the same wells so I asked them for this. I'll also going to be sending you a site map I requested a week or so ago so it helps put things into perspective about site locations of the wells. Anyway, the facility finally did CO testing yesterday and a repeat is happening today. There was a 1000 ppm reading in well 23, well 22 had an 800 ppm, and two other wells had 400-500 ppm. We haven't gotten a report yet, we were just on site yesterday and observed some of those. I think if today's results show similar levels, our waste section is going to request an action plan on addressing an event. A site map is on its way next. Let me know if you have any questions.

Todd

Kelly,

Do you have a spreadsheet that has all the well readings in it? Going back over the data submitted so far, we have several wells that don't appear on every sheet. In particular, I'll looking for all readings on wells, 21-28.

Thank you,

Todd
